

Exclusive Tag Manager

Custom, user-defined views of your IT infrastructure

With Galileo's Tag Manager, you can now assign custom, user-defined tags to any storage, server, SAN, or application assets that operate on your premises, in the cloud, or in a hybrid or virtual environment. The potential combinations of assets, components, and attributes meet every need imaginable.

The important decisions are up to you

Galileo's new Tag Manager revolutionizes the way IT users can connect, shape and rapidly visualize data center performance, configuration and capacity issues. Tag Manager transforms visual review and analysis of all assets within your entire IT environment in ways YOU define using our IT Intelligence Dashboards.

The possibilities are virtually limitless

Use Tag Manager with Galileo's IT Intelligence Dashboards to narrow performance, configuration, capacity views, and analysis to assets from a particular project, business unit, division, location, application, technology, cloud, and more. You can create tags such as "today's problem assets" or use tagging to group assets you want to monitor more closely for any reason.

Build intelligence into your tagging and bring specific focus to your views with multiple tags that group higher or lower-level visual views of asset associations. Tagging allows you to power the IT Intelligence Dashboards to target specific technologies and relationships based on what is important to your organization. Track configuration information for merger acquisition tracking, on-lease, off-lease, and much more.

IT Intelligence Dashboards

Using Galileo's Tag Manager, you can assign user defined labels to user-defined IT assets that meet a specific search query or attribute, then view that group of assets in either the Enterprise or Analytic Dashboards.

Tag Manager

The value is the ability to view how a project, a business unit, an environment or any other entity you define is using a particular set of assets. This is invaluable in terms of planning, management, and more.
